2273. POST-HEPATITIC CIRRHOSIS - Ciroza posthepatitică - Boeriu I., Dorian V., Hergcovici A. and Stein St. Clin. a III-a Med. I. M. F., Cluj - MED. INTERN.(Bucureşti) 1956, 8/5 (661-668)

The authors differentiate between posthepatitic cirrhosis, cirrhosis revealed by an icterus, subacute dystrophy of the liver, and chronic hepatitis. They demonstrate the possibility of the transformation of an acute hepatitis into cirrhosis, especially by liver biopsies. They studied 38 cases of cirrhosis during a period of 5 yr. In 14 they found epidemic hepatitis, in 17 alcoholism, in 10 lues as aetiological factors. There are 4 possibilities of evolution from the first hepatic episode up to the cirrhotic phase: (1) the hepatitis does not heal perfectly and minor signs of hepatic insufficiency persist, (2) transition to chronic hepatitis with recurrent icterus, (3) long period of latency (after the epidemic hepatitis) during which only hepatosplenomegaly, positive laboratory tests, biopsy or laparoscopy demonstrate the evolutiveness of hepatic damage and, (4) hypersplenism which conduces to cirrhosis. Cirrhosis is a polyaetiological manifestation and it is very important to know the signs of pre-cirrhotic stages. Epidemic hepatitis sometimes conduces without any remission to cirrhosis, but there are necessarily many other factors which induce cirrhosis such as fatigue, intoxications, various infectious diseases, vaccinations, etc.

PARAZITOL. 1956, 7/1-2 (93-99) Graphs 1 Tables 2

A parallelism between the amino-N content of the serum and the severity of the disease was observed. It was noticed that in mild forms of epidemic hepatitis, the amino-N level was within normal limits. It was increased in certain cases of hepatitis of the moderate type and exceeded the normal limit in all cases of prolonged hepatitis. High values were observed in the severe forms and in relapses also a parallelism was noticed between the gravity of the disease and the amino-N content of the serum. (XX, 6)

AUTHOR: Boesler, J.

TITLE: Binomial series as a substitute for differential equations

PERIODICAL: Aplikace matematiky, v. 5, no. 3, 1960, 216-224

TEXT: This paper was delivered at the Fourth Conference of Chemical Engineering in Prague. Differential equations can be conveniently expanded in binomial series which may, in the majority of cases, be substituted in a table form for calculation. This method is demonstrated on the progress of gas containing bensen (Fig. 1), the balanced condition of which is expressed by

$$\varphi a = \frac{b \cdot 100}{w}, \quad (1)$$

substituted in the differential equation $(a_0 - a) dG = db \quad (2)$

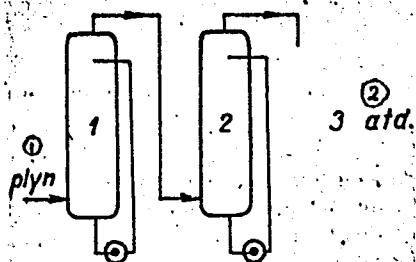

Card 1/5

Binomial series as a ...

Fig. 1

Legend: 1 - Gas; 2 - etc.

2/026/60/005/003/004/005

Obr. 1. Fig. 1

and leading to $G = \frac{\varphi W}{100} \ln \frac{a_0\varphi W - 100b_0}{a_0\varphi W + a\varphi W}$. This is too involved

for comfortable calculation. The process from one purifier to another (see Fig. 1 above) is, therefore, indexed from 1 to m in order to obtain

$$a_{11} = \frac{100}{\varphi W + 100} (a_1 + b_1) = K(a_1 + b_1)$$

$$b_{11} = \frac{\varphi W}{\varphi W + 100} (a_1 + b_1) = KL(a_1 + b_1)$$

Card 2/6

Z/026/60/005/003/004/005
D221/D302

Binomial series as a ...

and successively the following stages. For the next volume of gas in the first purifier, a_1 remains constant and the concentration of bensen in the purifying oil is b_{11} , so that

$$a_{11} = K(a_1 + b_{11}),$$

$$b_{11} = KL(a_1 + b_{11}).$$

By substituting the right hand side identity

$$a_{11} = \frac{100}{\varphi W + 100} (a_1 + b_1) = K(a_1 + b_1)$$

$$b_{11} = \frac{\varphi W}{\varphi W + 100} (a_1 + b_1) = KL(a_1 + b_1)$$

for b_{11} one obtains

$$a_{11} = Ka_1 + K^2L(a_1 + b_1),$$

$$b_{11} = KLa_1 + (KL)^2(a_1 + b_1).$$

Card 3/5

Z/026/60/005/003/004/005
D221/D302

Binomial series as a ...

The outlined method has to be carried out to the fifth or the sixth volume of gas so as to have a sufficient series for the numerical evaluation of coefficients which is laborious and involved. A simpler method can be applied by using the expression

$$b_1 = \frac{b_{11}}{KL} - a_1$$

from identity

$$a_{11} = \frac{100}{\varphi W + 100} (a_1 + b_1) = K(a_1 + b_1)$$

$$b_{11} = \frac{\varphi W}{\varphi W + 100} (a_1 + b_1) = KL(a_1 + b_1)$$

and by substituting in succession always b_1 for b_{11} . In this way the value of b_1 can be evaluated before the final transit of the

Card 4/6

Z/026/60/005/003/004/005

D221/D302

Binomial series as a ...

ninth volume of gas is completed, b_1 being the concentration of bensen which accompanied the oil from the second to the first purifier. The concentration a_{11} which remains in the gas, can be obtained by subtracting $b_{11} - b_1$ from a_1 . A numerical example is presented by means of the first method in evaluating coefficients of the series to the fourth degree. The same example is worked out by using the simple method and tabulated to the fourth degree (four purifiers) and to the seventh degree (seven purifiers) respectively as shown in the two tables in the article.

TITLE: Research on protective lead blocks produced at the Medical Instruments and Equipment Plant in Sofia.

SOURCE: Mashinostroenie, no. 11, 1965, 501-503.

TOPIC TAGS: lead, nuclear protective equipment, radiation protection, nonmilitary nuclear application, medical equipment

ABSTRACT: The properties of protective lead blocks produced at the Medical Instruments and Equipment Plant (Mediko-instrumentalniya i aparaturen zavod) in Sofia were studied for the purpose of improving the manufacturing technology of the blocks for series production. The measurement were made in accordance with standards developed by the Council for Mutual Economic Assistance in the Utilization of Atomic Energy for Peaceful Purposes (SIV). The measurement results show that 1) the specific gravity of the lead blocks is 10.8 g/cm^3 within an accuracy of $\pm 0.9\%$ and satisfies the standard requirements, 2) the Brinell hardness varies from 10.5 to 11.5 kg/mm^2 , and 3) the deviation from homogeneity is smaller than the permissible deviation of

10%. The flaw detector used in the investigation was designed by Sl. Ormandzhiev, an engineer, of the Physics Department. It is noted that the SIV standards are incomplete and that it is desirable to develop them further in order to improve the quality of the lead blocks which are being exported to the member countries of SIV. Orig. art. has: 5 figures and 1 table.

"Relationship Between the Appearance of Spike Potentials in the
Electrogastromyogram and the Intensity of the Contraction Wave of the
Gastric Wall"

Sofia, Doklady Bolgarskoy Akademii Nauk, Vol 19, No 3, 1966, pp 241-244

Abstract: [English article] It was established earlier that the stomach wall contracts . without interruption and that there are slow polyphase changes in the electrogastromyogram corresponding to these low-amplitude contractions of the gastric wall. When these rhythmic contractions increase their amplitude, i.e., when they become stronger, there are groups of spike potentials appearing in the electrogastromyogram. Experiments with 15 dogs were made for the purpose of establishing the relationship between the appearance of spike potentials and the intensity of the contraction wave. Strain-gauges were used to record the contractions of the gastric wall. The article presents the description of experimental procedures, summarizes the results, compares the new findings with those of other authors, and discusses the possible connections between the motor and bioelectric activities of the stomach. There are 1 Bulgarian, 1 Soviet, and 7 Western references. (Manuscript received, 8 Dec 65.)
